

## ■ SOYBEAN,

From Page 2

levels. She encouraged producers to test their soils before planting soybeans-on-soybeans. Free SCN testing courtesy of South Dakota Soybean Research and Promotion Council Testing for SCN is free of charge courtesy of the South Dakota Soybean Research and Promotion Council. "There is still time to test soils before soybean planting this year," Strunk said. She added that soil sampling for SCN can be done anytime provided the soil is not frozen or too wet. "Knowing the status of SCN in a field will help in deciding the need for SCN-resistant cultivars." For fields with a history of SCN, Strunk said it is important to keep testing soils to monitor SCN build up in the field. "If SCN numbers keep on rising, this

would mean SCN intervention methods being applied are not working," she said. "Therefore longer rotations out of soybeans and change in SCN resistant cultivars would be recommended." Seed treatment may be another disease management strategy that producers planning soybeans-on-soybeans may want to consider, Byamukama said. "Especially for fields with a history of soybean stand establishment problems. Although pathogens causing seedling diseases in soybeans can survive in soil for several years, soybeans following soybeans have increased level of inoculum in the soil," he said. He added that for foliar diseases where resistance is not available (e.g. brown spot, frogeye leaf spot, downy mildew) early scouting for disease pressure and applying a timely fungicide application

will protect yield. "Research conducted at SDSU and other universities in the region indicate a higher probability of return on investment when foliar fungicide application is done under significant disease pressure before or at R3 growth stage coupled with relatively wet weather conditions," Byamukama said. In making crop rotation decisions, producers may want to consider long term profitability of a crop rather than focusing on one season's profit. Decisions made in one season may affect the productivity and therefore profitability of the crop in multiple upcoming seasons.
